
BIOGRAPHICAL SKETCH

Provide the following information for the Senior/key personnel and other significant contributors.
Follow this format for each person. **DO NOT EXCEED FIVE PAGES.**

NAME: Brunson, Jason Cory

eRA COMMONS USER NAME (credential, e.g., agency login): BRUNSONJ

POSITION TITLE: Assistant Professor

EDUCATION/TRAINING (*Begin with baccalaureate or other initial professional education, such as nursing, include postdoctoral training and residency training if applicable. Add/delete rows as necessary.*)

INSTITUTION AND LOCATION	DEGREE (if applicable)	Completion Date MM/YYYY	FIELD OF STUDY
Virginia Tech, Blacksburg VA	B.S.	05/2004	Mathematics
Virginia Tech, Blacksburg VA	B.S.	08/2004	Statistics
Virginia Tech, Blacksburg VA	M.S.	05/2005	Mathematics
Virginia Tech, Blacksburg VA	Ph.D.	12/2013	Mathematics
UConn Health, Farmington CT	Postdoc	08/2017	Quantitative Medicine
UConn Health, Farmington CT	Postdoc	04/2020	Network Modeling in Healthcare

A. Personal Statement

Following my PhD in Mathematics, a research assistantship in social network analysis, and an adjunct teaching professorship, I completed two postdoctoral fellowships at UConn Health in the Center for Quantitative Medicine (CQM). I was first hired in 2014 to train as a data scientist under the supervision of Dr. Reinhard Laubacher. During this time, I investigated the structure and determinants of scientific collaboration and applications of network analysis to routinely-collected healthcare data ("health data"). In 2017, I was awarded a fellowship with the UConn–NIDCR T90/R90 Research Training Program under Dr. Mina Mina. My project initially focused on network models of comorbidity, then grew to include topological data analysis, machine learning, and open source software development. I have worked at the University of Florida since 2020 as an Assistant Professor.

I collaborate with colleagues in several specialties to apply descriptive, predictive, and interpretable modeling to biomedical problems: I supervised a study of localized models to predict and identify personalized risk factors for readmission and mortality among critical care patients and recently completed a follow-up study on COVID-19 infection. I have collaborated with a team of psychiatrists and psychologists to identify personal and societal determinants of occupational burnout and behavioral treatment response. I am continuing a project to build clinical decision support tools from patterns in health data to better stratify patients for alpha-1 antitrypsin screening. Finally, I worked with a team of specialists in interstitial lung disease and lung transplantation to detect, measure, and explain socioeconomic disparities in post-transplant outcomes, and more recently to identify predictors of severe primary graft dysfunction in lung recipients. I am currently leveraging my quantitative background and my collaborations in lung transplantation and computational modeling toward biomarker discovery, pathway analysis, and mechanistic modeling of outcomes following lung transplantation.

With regard to this proposal, I will work closely with colleagues on the HIV/AIDS project, collaborate frequently with colleagues in the Model and Data Sharing Core, and liaise frequently between these. Specifically: I will work with Dr. Salemi and his colleagues to acquire, assemble, pre-process, tidy, and analyze data sets from the Florida Department of Health and from the OneFlorida+ Data Trust in preparation for modeling and as modeling needs require. I will work with Dr. Knapp to develop, implement, and document agent-based models for each aim, including calibration and validation using empirical data, with emphasis on the agent-based evolving network

models of Aim 3. I will work with Dr. Prosperi to design, implement, and document the transfer learning procedure of Aim 2.2. In each case, I will also contribute to the open-access publication of these models on established code repositories. Finally, I will work with Dr. Sego and the Model and Data Sharing Core to convert and validate models in multiple software languages and on diverse platforms, and to publish them with clear documentation including fully worked through examples online.

Ongoing and recently completed projects that I would like to highlight include:

The University of Florida Clinical and Translational Sciences Institute Pilot Award (Parent award: NIH/NCATS UL1 TR001427)

Role: PI

08/01/22–04/30/24

Efficient Modeling of Individualized COVID-19 Mortality Risk

R Consortium Infrastructure Steering Committee Grant Program. (24-ISC-1-06)

Role: PI

10/01/24–05/31/25

Modular, interoperable, and extensible topological data analysis in R

B. Positions, Scientific Appointments, and Honors

2020–Present	Research Assistant Professor, Laboratory for Systems Medicine, University of Florida, Gainesville, FL
2017–2020	Postdoctoral Fellow, Skeletal, Craniofacial & Oral Biology Training Program, UConn Health, Farmington, CT
2014–2017	Postdoctoral Fellow, Center for Quantitative Medicine, UConn Health, Farmington, CT
2014	Adjunct Professor, Department of Mathematics, Radford University, Radford, VA
2010–2013	Research Assistant, Virginia Bioinformatics Institute, Virginia Tech, Blacksburg, VA

C. Contribution to Science

1. *Network science*. As a Research Assistant and mentor, together with a team of undergraduates, I was introduced to network analysis and scientometrics at a summer program organized around systems biology. Our study of the mathematics literature, and a later collaboration focused on biomedicine, combined conventional and original tools to describe global changes in collaboration patterns in both communities over recent decades, and our results have been cited in both follow-up research and several commentaries on scientific practice. I have since kept up an active program of network science, which has involved collaborations with domain experts in immune response and cell biology on original applications of advanced graph theory to modeling cell signaling and capillary development. Network science has also been a major part of my more recent work involving administrative healthcare data, as detailed in the next section.

2. *Health informatics*. I self-trained at CQM as a data scientist, which entails a combination of statistical literacy, computational programming, and consultancy, with a focus on the pre-processing, analysis, and modeling of administrative healthcare data sets. I conducted a systematic review of studies that use network analysis to study healthcare data, a literature that contains myriad projects in diverse domains. My review synthesized this literature and taxonomized its methods in service to the field, but it also revealed to me that the increasingly popular use of “comorbidity networks” suffers from inconsistent methodology and uncertain validity. In response, and with a physician–informaticist colleague, we conducted a sensitivity analysis of techniques that have been used to study comorbidity networks, which we hope will encourage more consistent and transparent work in future. In addition to my scientific work, I completed a training collaboration with the Office of the State Comptroller of Connecticut, analyzing prescription patterns in claims data as part of an investigation into compound pharmacy fraud, and I collaborated with a pharmacist–scientist to develop a set of software packages to expedite comparative effectiveness research using claims databases. I use my background in reproducibility to ensure in each case that my analysis is reproducible, auditable, and reusable. I have also worked to bring somewhat niche geometric and topological data analysis techniques into more mainstream use by way of open source software development.

3. *Descriptive and predictive modeling*. Since joining the University of Florida (UF), I have begun collaborations with several clinician–researchers, in Psychiatry, Psychology, and Family Medicine as well as in Pulmonary. My work includes some conventional statistical analysis, for example to describe determinants of healthcare worker burnout during the pandemic or to predict post-transplant outcomes among lung recipients, as well as cutting-edge model development, for example integer programming to develop a simple risk score for severe AATD that we hope will inform screening recommendations. As I came to appreciate the limitations of network analysis to predictive modeling and hypothesis testing, I developed an interest topological data analysis (TDA). This led an MD–PhD student and I to develop sampling procedures to improve TDA selection procedures for predictive models using health data, which violates many of the implicit assumptions satisfied by so-called “point cloud” data. This led me to couple an artificial intelligence approach called case-based reasoning into a machine learning framework in order to improve the predictive accuracy of models without cost to their interpretability. We are using these “localized” models to enhance mortality prediction in ICU and cardiac outcomes for COVID-19, using patient data obtained from electronic health records. A scoping review of this approach and two empirical studies, all with student collaborators, are submitted or in preparation, and this approach is the basis for my CTSI Precision Health Initiative pilot award.
